# Problem Statement

The rapid growth of Android-based financial applications has been accompanied by an increase in malicious APKs that impersonate legitimate banking apps, steal credentials and OTPs, and communicate with attacker-controlled infrastructure. Traditional malware analysis is often manual, time-consuming, and difficult to scale, delaying incident response and increasing the risk of financial fraud.

Antivirus is obsolete against modern malware

Malware rebuilds its file fingerprint on every distribution, antivirus engines never see the same hash twice and miss it entirely.

Manual reporting is time-consuming and inconsistent

Investigators benefit from standardized, evidence-backed reporting and reproducible analysis workflows.

Malware knows when it's being watched and hides

Advanced trojans detect sandbox environments and go dormant. The lab gets a clean result.

The fraud continues.

# OUR SOLUTION – SecureX

## AI-Powered Automated Android Malware Analysis Platform

APK Threat Hunter enables banks and security teams to upload a suspicious Android APK and receive an explainable, evidence-backed forensic assessment within minutes. By combining static analysis, controlled runtime observation, threat intelligence, and AI-assisted reasoning, the platform accelerates malware triage and reduces manual investigation effort.

Security analysis techniques range from static to dynamic.

### Streamlined Data Analysis Process

# Difference

## The Detection Gap Is Not a Tools Problem, It Is an Intelligence Problem

| Existing Solutions                               | Our Solution – SecureX                                                  |
|--------------------------------------------------|-------------------------------------------------------------------------|
| Relies mainly on signature-based detection       | Uses AI-assisted static + behavioral analysis for deeper insights       |
| Manual reverse engineering takes hours or days   | Automated pipeline significantly reduces analysis time                  |
| Produces raw technical logs                      | Generates plain-language explanations and investigator-friendly reports |
| Static and dynamic tools often work in isolation | Correlates multiple evidence sources into a unified analysis            |
| Difficult to prioritize new or suspicious APKs   | Provides an explainable risk score based on observed evidence           |
| Reports vary by analyst and workflow             | Produces standardized, consistent forensic reports                      |
| Requires significant cybersecurity expertise     | Designed to assist analysts and accelerate investigations               |
| Limited visibility into overall threat context   | Integrates threat intelligence and IOC correlation for richer insights  |
